Research databases

What is CORE-Hom?

The Clinical Outcome Research in Homeopathy database contains all types of clinical outcome studies, from randomised controlled trials to observational studies.

At present it comprises **1015 clinical trials on homeopathy**, but this number will change as the database is continually improved and updated with newly published trials.

CORE-Hom is the most comprehensive and academically rigorous database of its kind in the world, and the only homeopathy database providing information about the *quality* of the studies it contains.

[Access the CORE-Hom database](#)

This world-class resource, which was several years in the making, is the result of a close collaboration between HRI and the highly esteemed [Karl und Veronica Carstens Foundation](#) in Germany.

6) For research on CAM
